

## artec technologies AG demonstrates the XENTAURIX Media & Broadcast Logging System at IBC 2022, hall 7, booth B08

At the IBC 2022 the artec technologies team will demonstrate their XENTAURIX Media & Broadcast Logging System which is used as an added value service platform for monitoring, compliance recording, search, analysis of TV, radio and video sources including available metadata, clip creation as well as content re-purposing. With the software extension modules, features such as TS Native recording, loudness monitoring, advertising recognition, music recognition, AI-based content recognition, TV-ratings analysis, web page recording and others are available. XENTAURIX Systems offer media intelligence service solutions for Broadcasters, Networks, Cable, Telco, Satellite Operators and Media Companies.

### Easy operation – User friendly

The modern HTML5-based dashboard with the various templates offers a combination of multiscreen live signal and playback, metadata, clip creation, search functions, storyboard and analysis tool displays on one interface. Layouts can be created individually and stored user-specifically locally as well as centrally. Video clips can be edited quickly and easily via drag & drop, cut frame-accurately and uploaded at the click of a mouse. Framestore-based recording technology allows clients to switch from live viewing directly to instant replay and create video clips in this mode as well.

### Highly Reliable

The XENTAURIX Media & Broadcast Logger is a high-performance monitoring and recording system, with which any number of channels can be recorded in the desired recording duration of weeks, months up to years in the original or in customer-specific quality in 24/7 mode or time-controlled via a timer. The systems are equipped with Raid hard disk arrays and redundant power supply units and can be monitored remotely. For high availability requirements, the Professional System is available in cluster fail-back design.

### Expandable and modernizable at any time

XENTAURIX Media & Broadcast Loggers range from single-channel versions to systems with hundreds to thousands of channels and can be expanded and modernized at any time. Systems in different locations can be connected centralized. XENTAURIX systems are in use worldwide since 2001.

### About artec technologies AG

artec technologies AG - listed on the stock exchanges - is based in Diepholz/Germany. artec develops and produces innovative software and system solutions for the monitoring, recording and analysis of video, audio and metadata in networks or the internet. Since the year 2000 customers have been using artec's brands MULTIEYE® for Video Surveillance Solutions and XENTAURIX® for Media & Broadcast Logging and Streaming.
